Home

About this project

This is a simple C# program that downloads a wiki from GitHub, converts it to a merged Html and generates a PDF file with all the content of the wiki. I wrote it because I found no satisfactory way to create a single PDF in one step.

Usage

```
GitHubWikiToPDF -user= -project= [-css=]
```

For example: GitHubWikiToPDF -user=simionsoft -project=SimionZoo -css=style.css``

Dependencies

When compiling, the only dependence is **IronPdf** which is downloaded automatically by Visual Studio using NuGet.

When running, the program requires **Git** to be installed, since it uses it to download the complete repository of the wiki.
